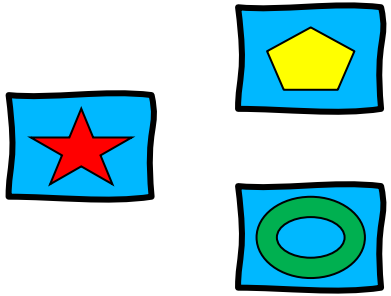
Evolution of Microservices

Microservices

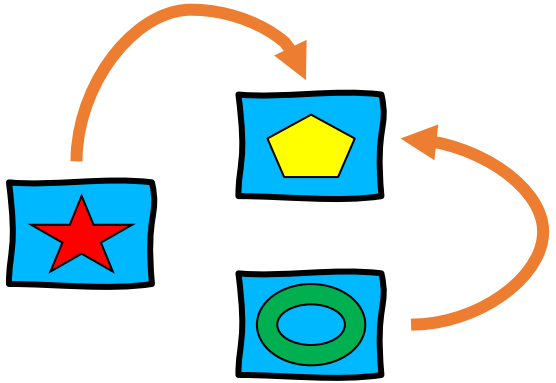
An engineering approach focused on decomposing an application into single-function modules with well defined interfaces which are independently deployed and operated by a small team who owns the entire lifecycle of the service.

Microservices accelerate delivery by minimizing communication and coordination between people while reducing the scope and risk of change.

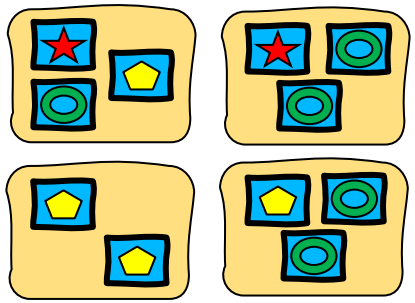
Microservices Application



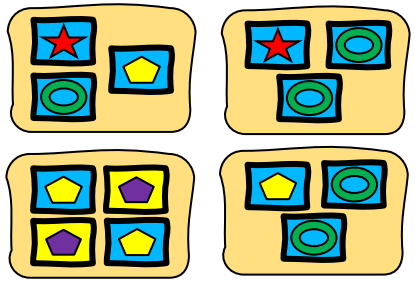
Microservices Application Interactions



Microservices Application Scaled



Microservices Application Update

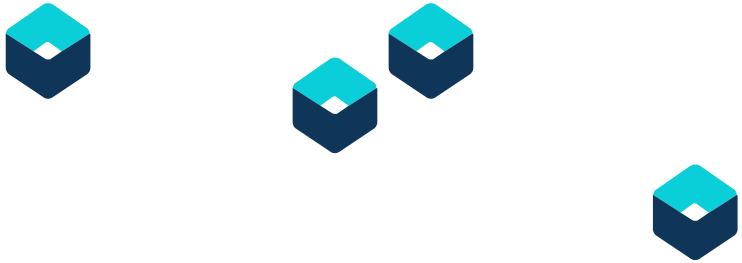


Microservices, Containers and Container Orchestrator

Typically microservices are encapsulated inside containers ...

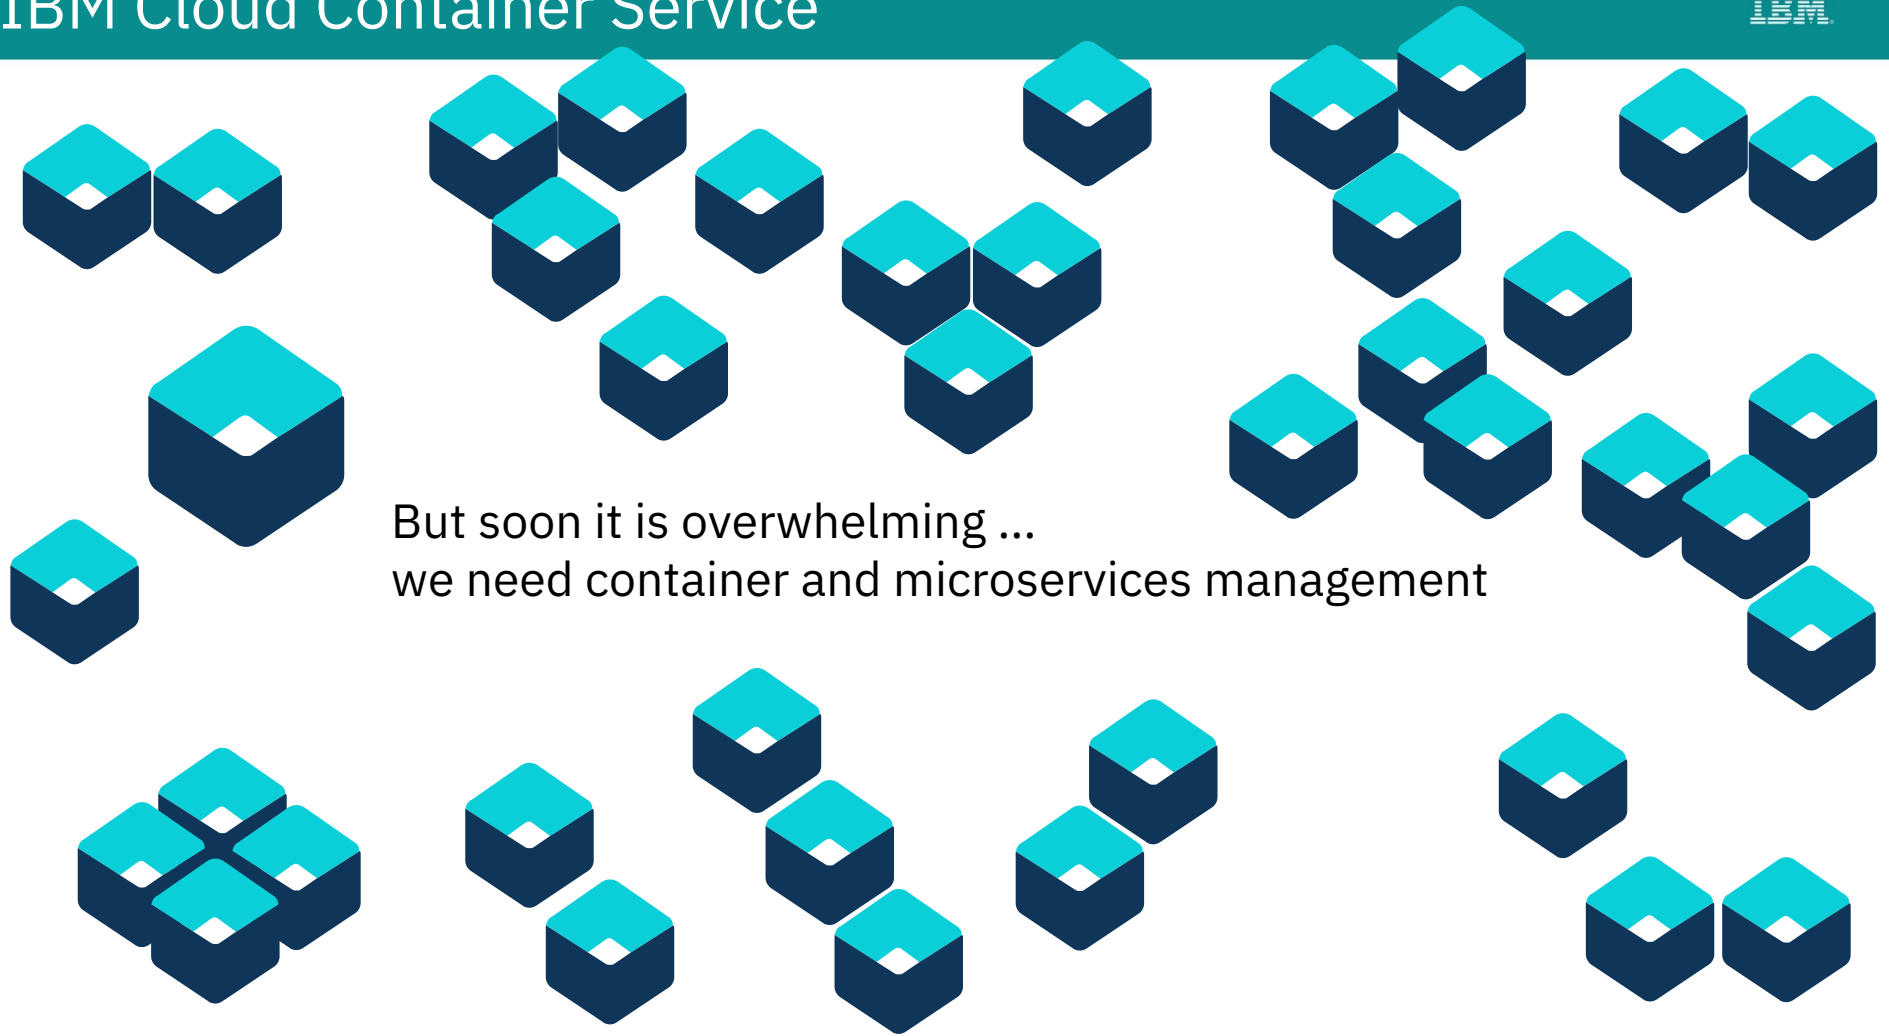
One:One relationship between a microservice and a container

Everyone’s container journey starts with one container ...



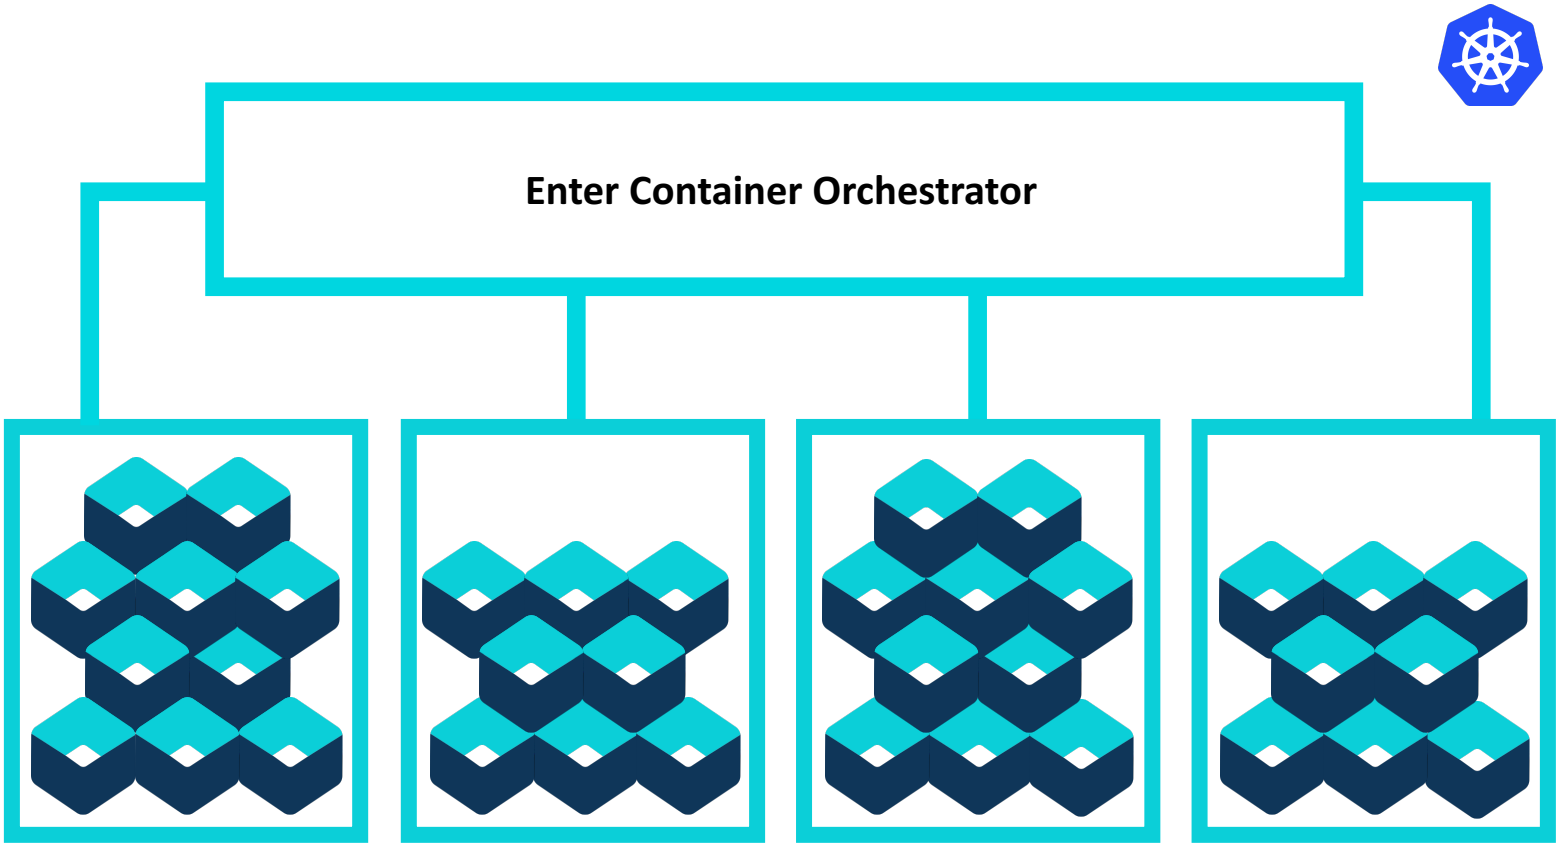
At first the growth is easy to handle ...

IBM Cloud Container Service

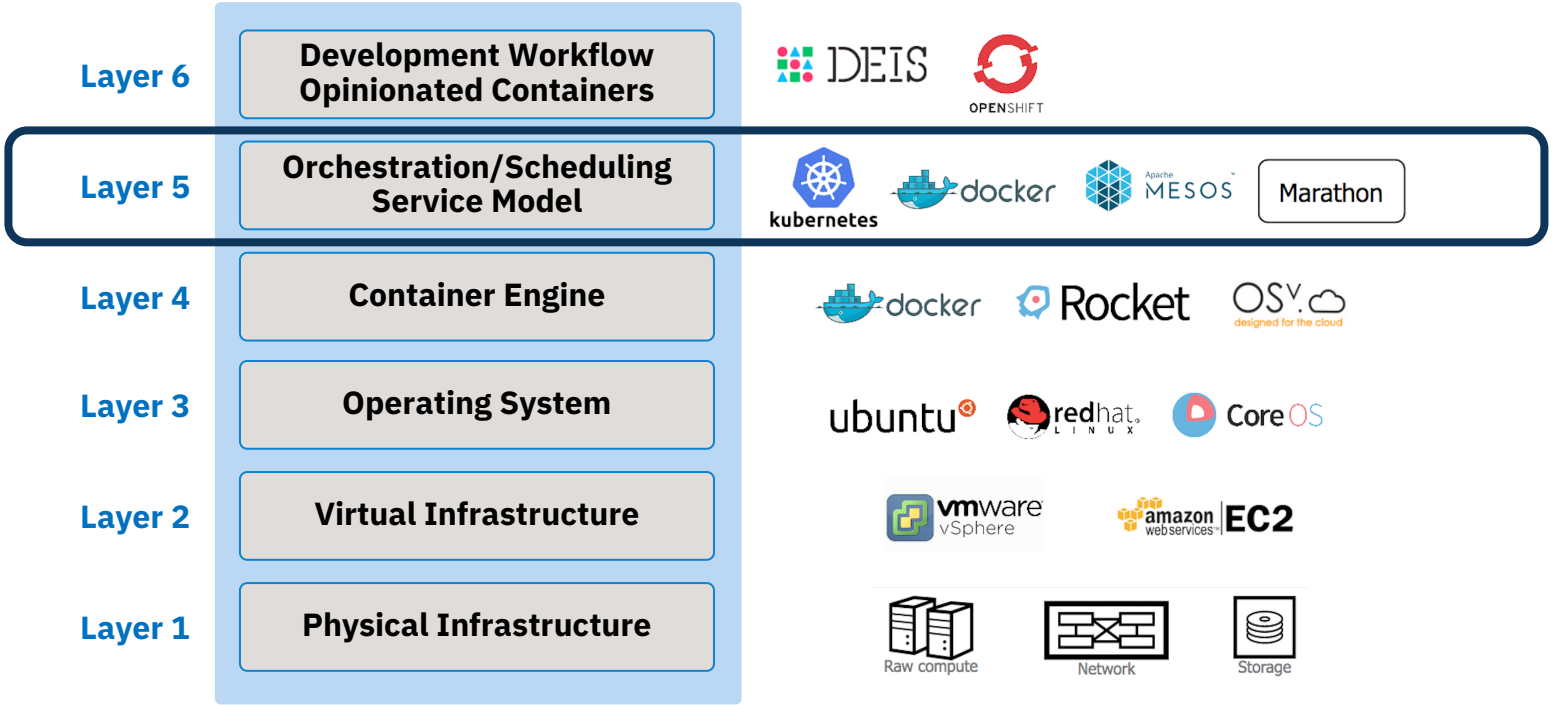


But soon it is overwhelming ...
we need container and microservices management

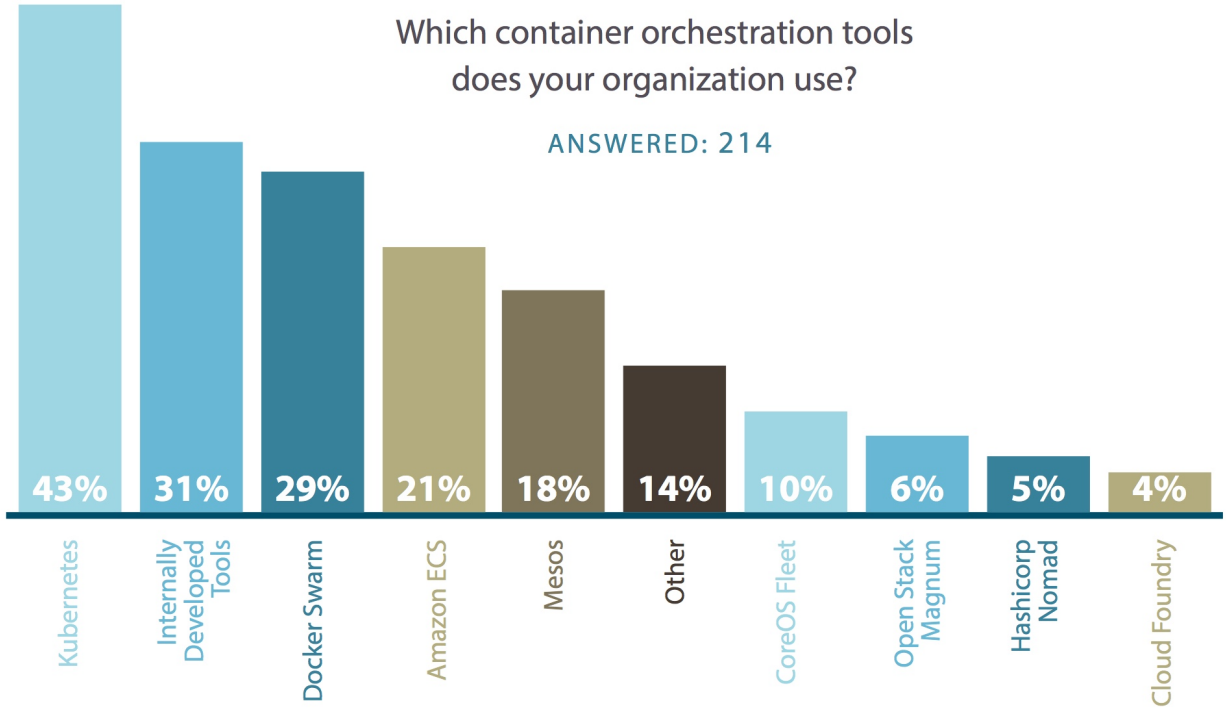
IBM Cloud Container Service



Container Stack



Container Orchestration



Source: devops.com

Kubernetes

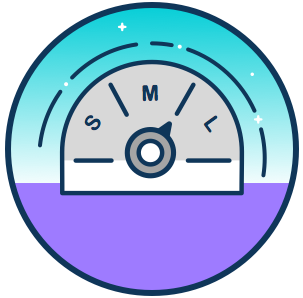
What is Kubernetes?

- Container orchestrator
- Runs and manages containers
- Supports multiple cloud and bare-metal environments
- Inspired and informed by Google's experiences and internal systems
- 100% Open source, written in Go
- Manage applications, not machines
- Rich ecosystem of plug-ins for scheduling, storage, networking

IBM Cloud Container Service

Intelligent Scheduling

Self-healing



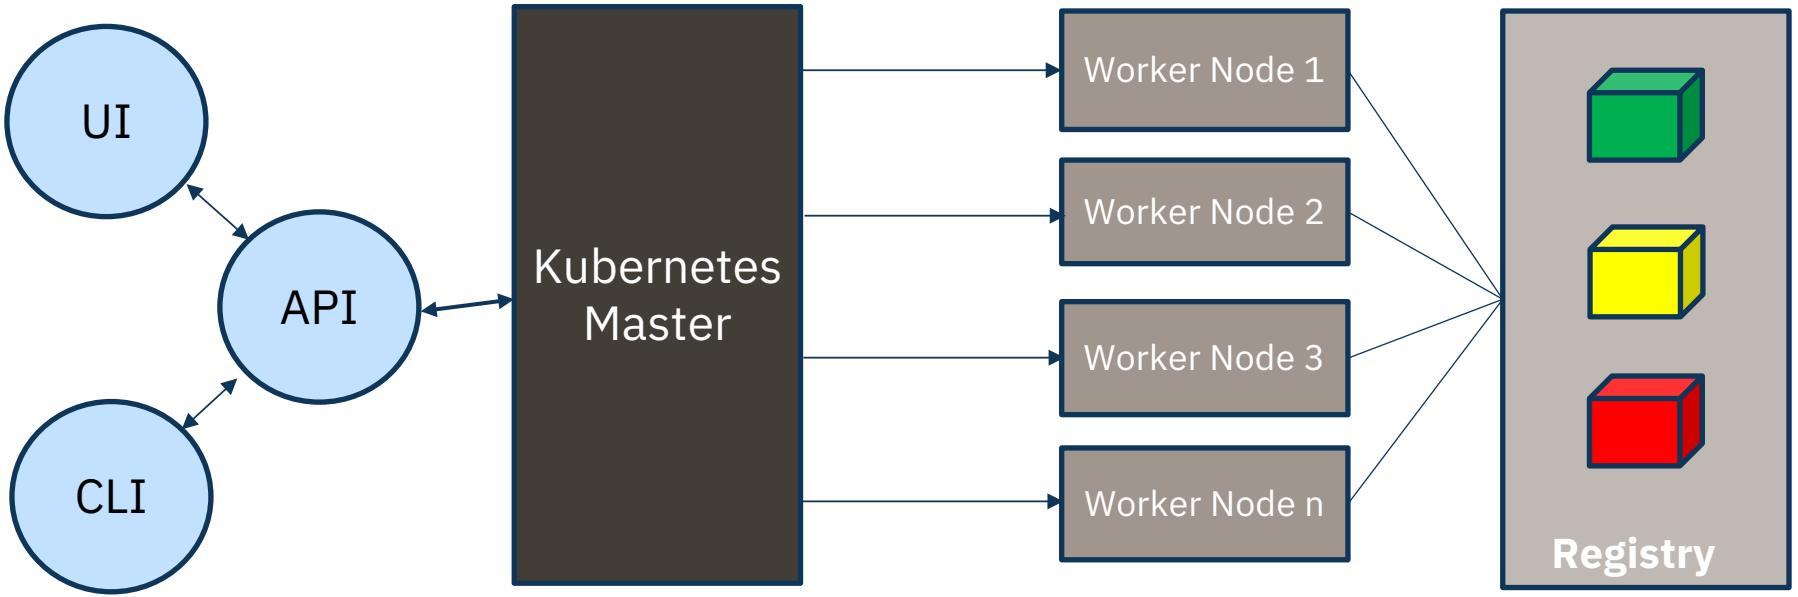
Horizontal scaling

Service discovery & load balancing

Automated rollouts and rollbacks

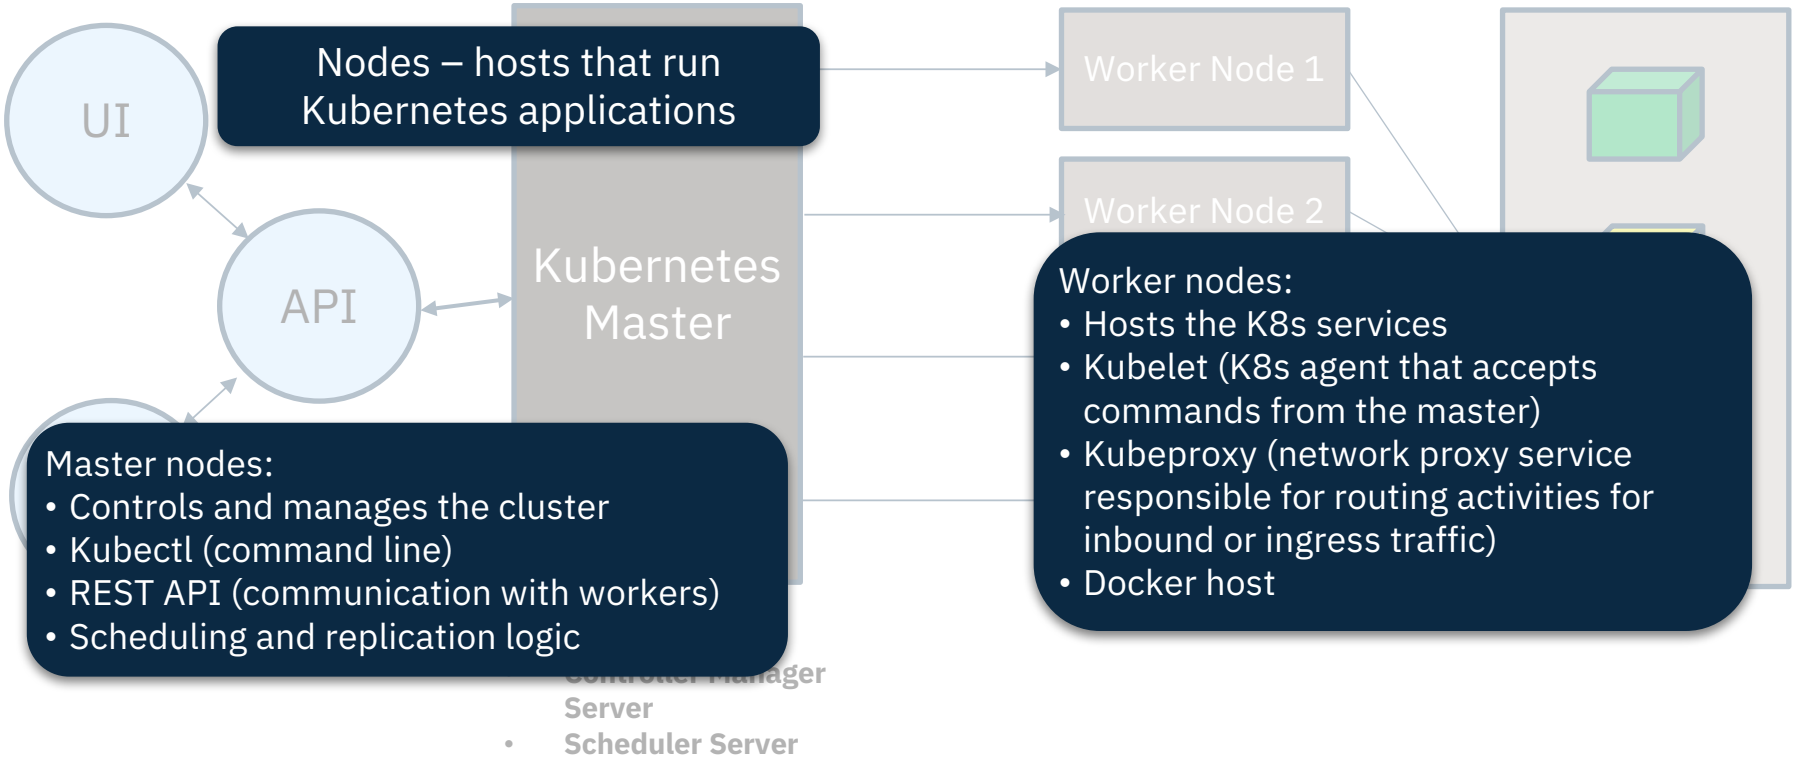
Secret and configuration management

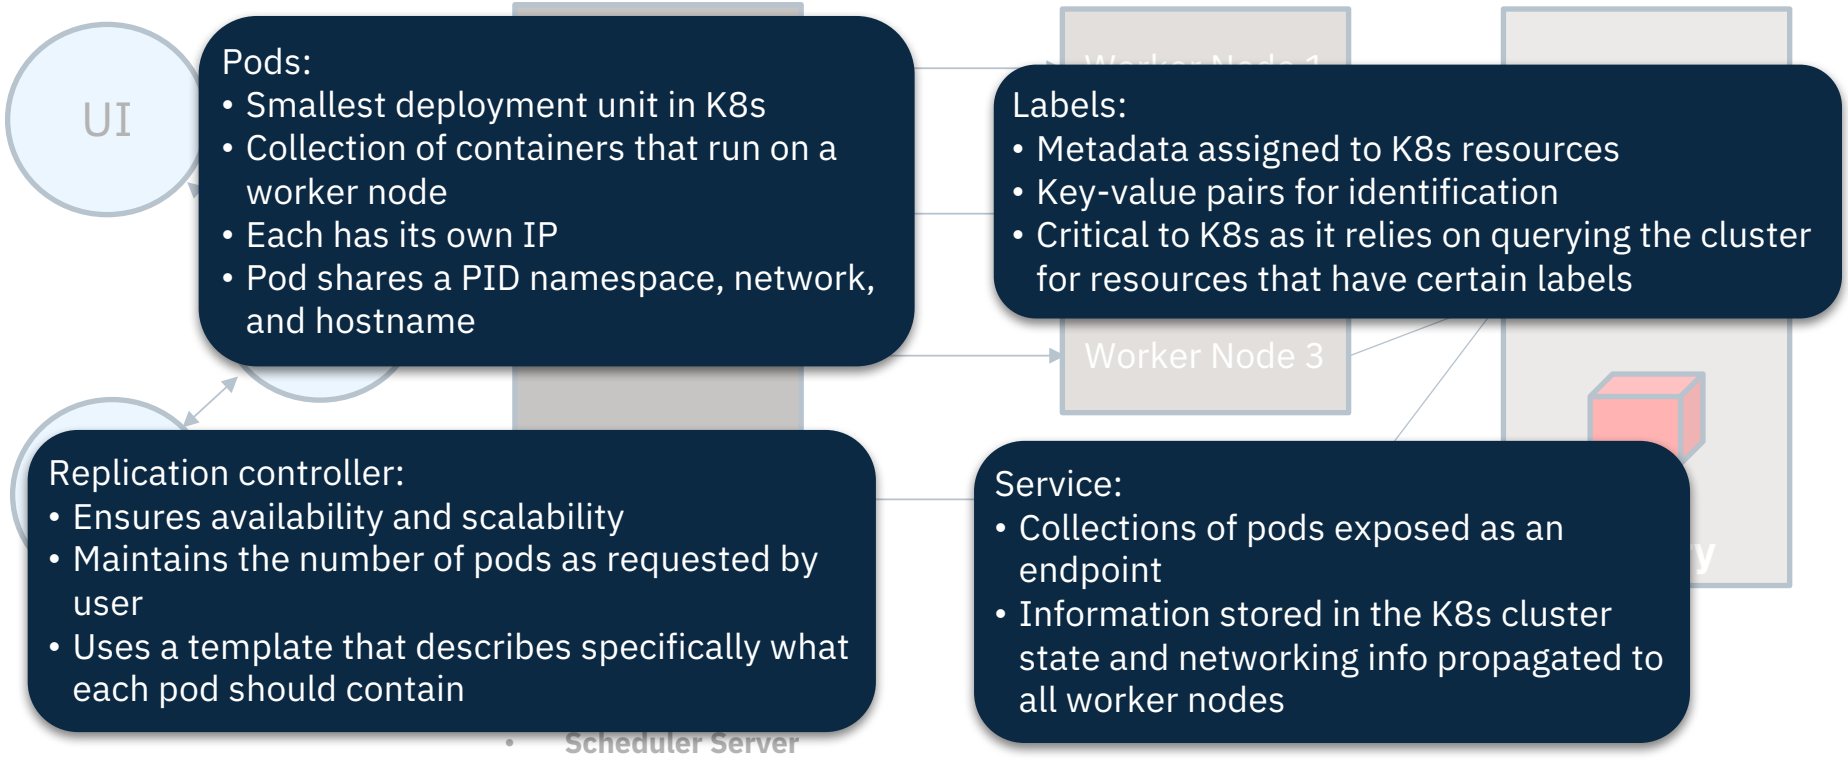
Kubernetes Architecture



- **Etcd**
- **API Server**
- **Controller Manager Server**
- **Scheduler Server**

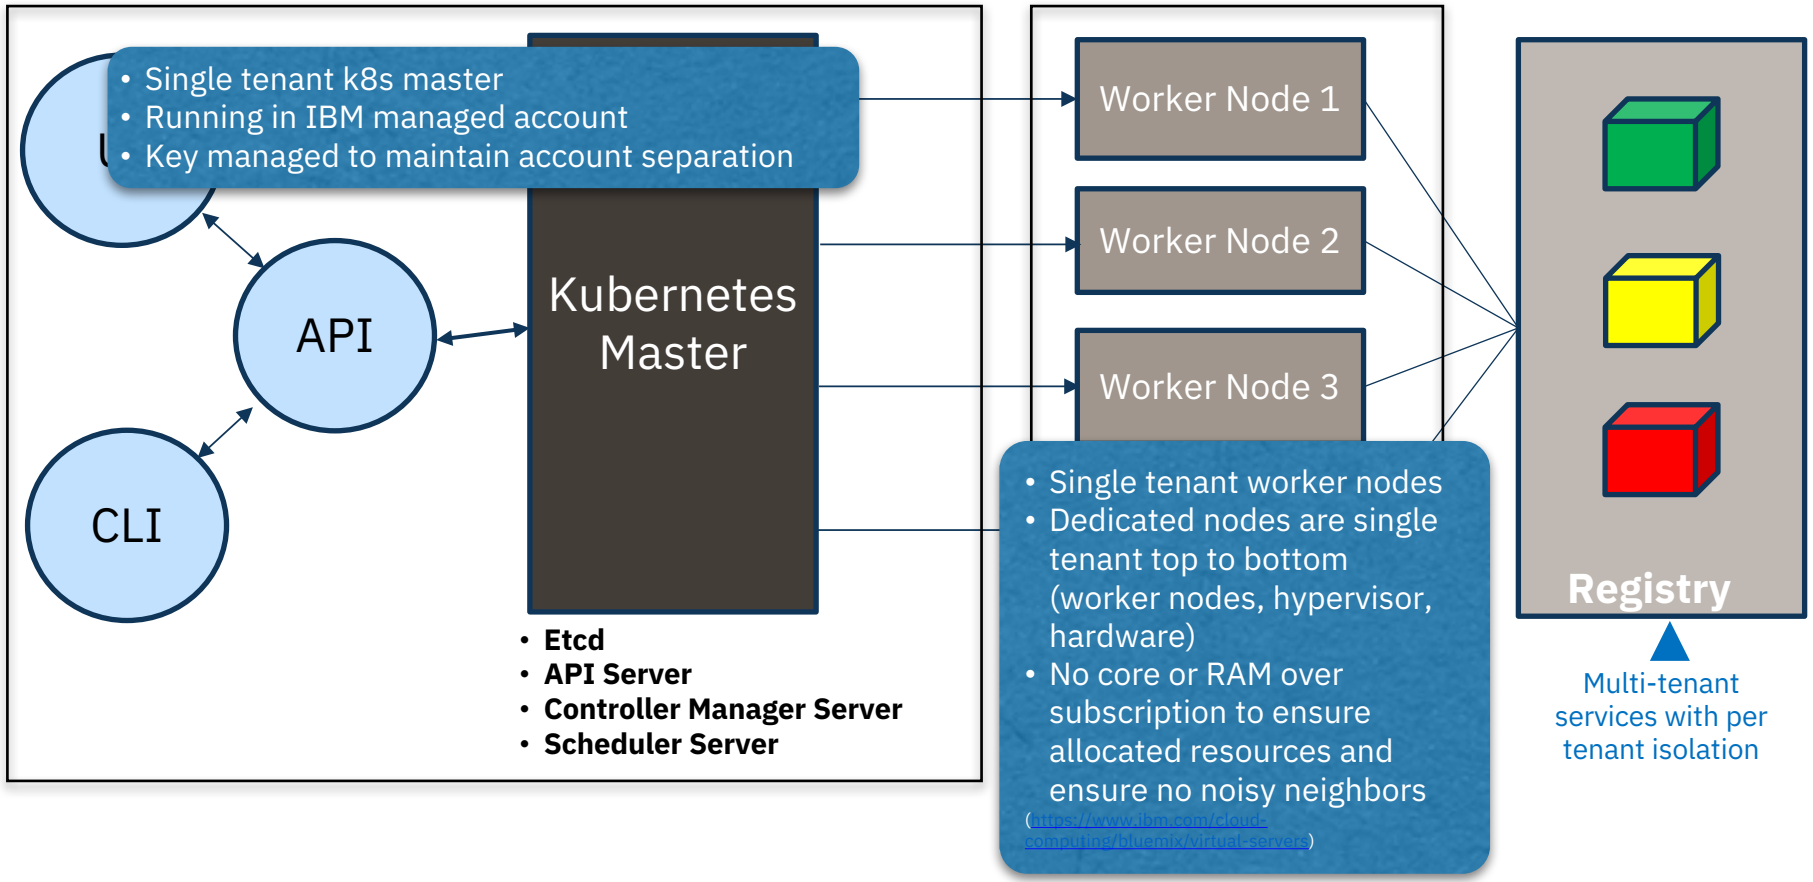
Kubernetes Architecture



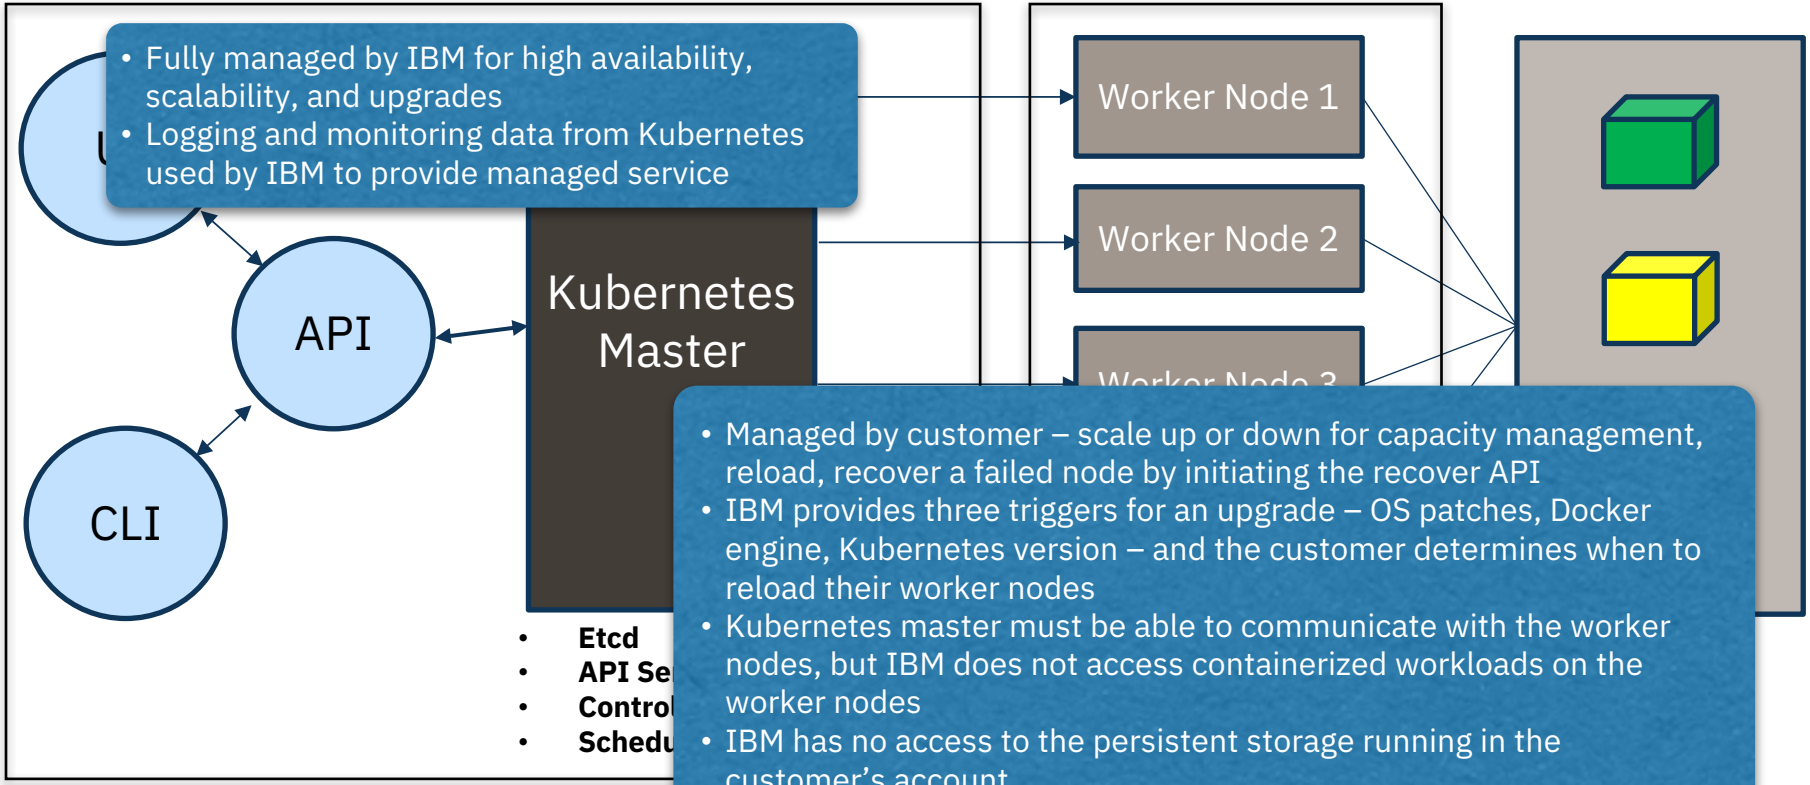


UI
Pods:
• Smallest deployment unit in K8s
• Collection of containers that run on a worker node
• Each has its own IP
• Pod shares a PID namespace, network, and hostname
Labels:
• Metadata assigned to K8s resources
• Key-value pairs for identification
• Critical to K8s as it relies on querying the cluster for resources that have certain labels
Worker Node 3
Replication controller:
• Ensures availability and scalability
• Maintains the number of pods as requested by user
• Uses a template that describes specifically what each pod should contain
Service:
• Collections of pods exposed as an endpoint
• Information stored in the K8s cluster state and networking info propagated to all worker nodes
Scheduler Server

IBM Cloud Container Service



IBM Cloud Container Service



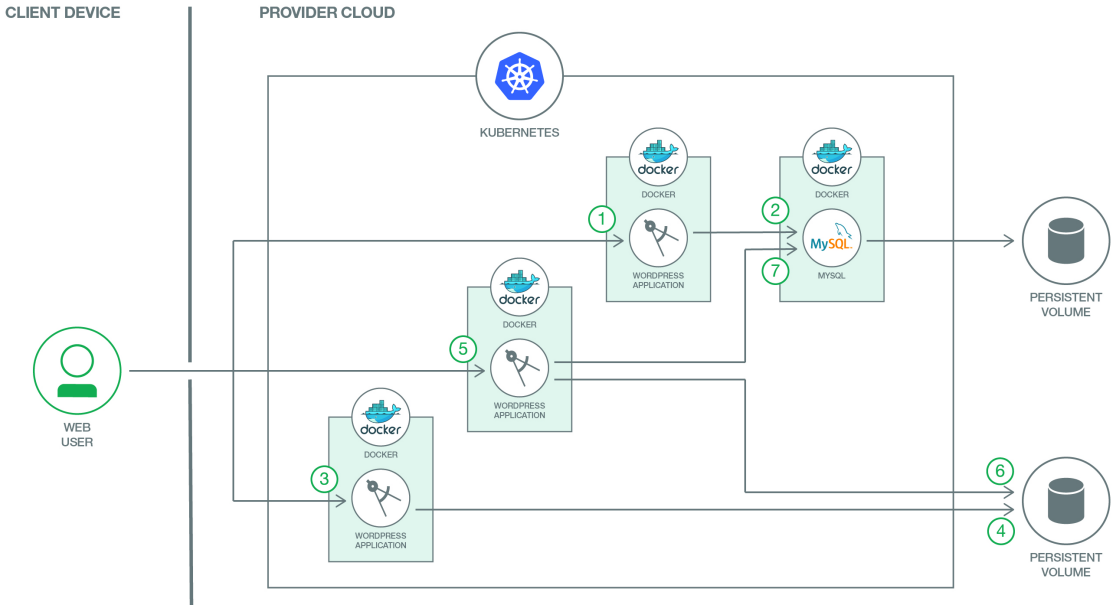
Kubernetes Developer Journeys

Developer Journeys: Scalable Wordpress on Kubernetes

In addition to running MySQL inside a container, we also show advanced capabilities like IBM Cloud service binding by leveraging Compose for MySQL service

Developer Works Code: https://developer.ibm.com/code/journey/scalable-wordpress-on-kubernetes

Github: https://github.com/IBM/scalable-wordpress-deployment-on-kubernetes

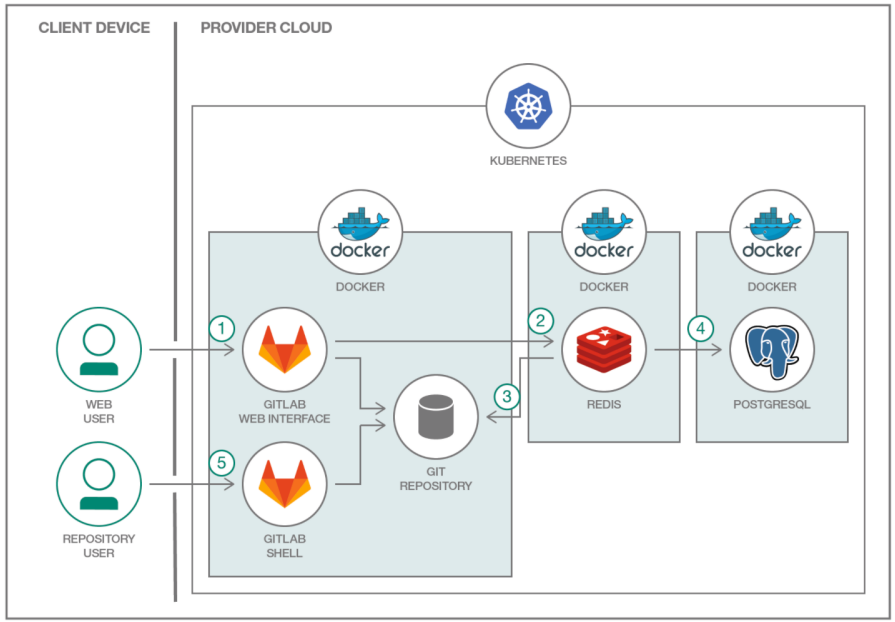


Developer Journeys: Deploy a Distributed GitLab on Kubernetes

This project shows how a common multi-component application can be deployed. GitLab represents a typical multi-tier app and each component will have their own container(s).

Developer Works Code: https://developer.ibm.com/code/journey/run-gitlab-kubernetes/

Github: https://github.com/IBM/kubernetes-container-service-gitlab-sample

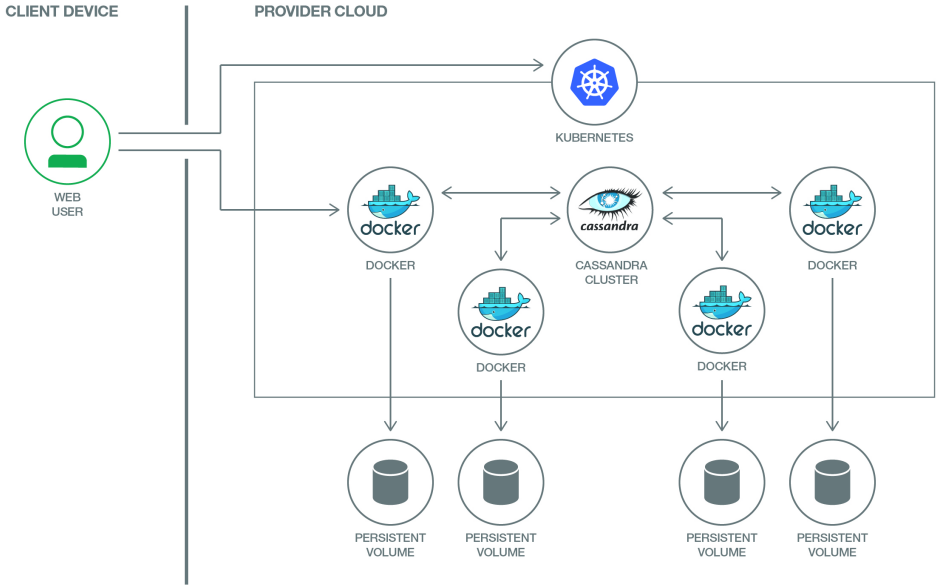


Developer Journeys: Scalable Apache Cassandra on Kubernetes

Leverages Kubernetes Pods, Service, Replication Controller, StatefulSets

Developer Works Code: https://developer.ibm.com/code/journey/deploy-a-scalable-apache-cassandra-database-on-kubernetes

Github: https://github.com/IBM/scalable-cassandra-deployment-on-kubernetes



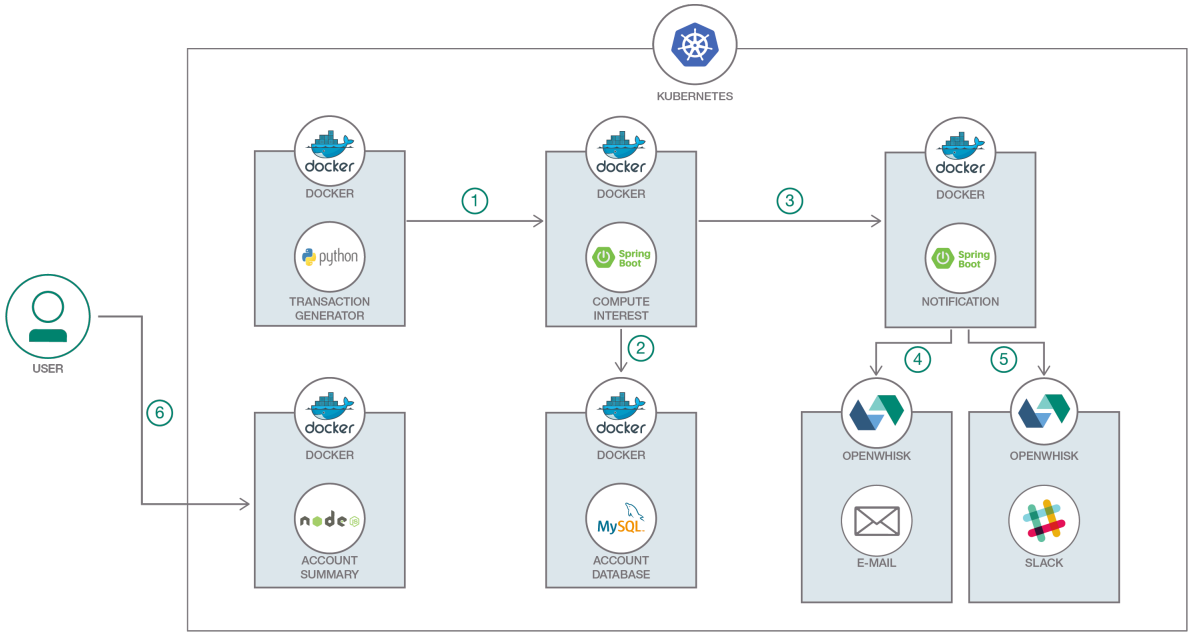
Kubernetes & Microservices Developer Journeys

Developer Journeys: Spring Boot Microservices on Kubernetes

This journey shows you how to create and deploy Spring Boot microservices within a polyglot application and then deploy the app to a Kubernetes cluster.

Developer Works Code: https://developer.ibm.com/code/journey/deploy-spring-boot-microservices-on-kubernetes/

Github: https://github.com/IBM/spring-boot-microservices-on-kubernetes

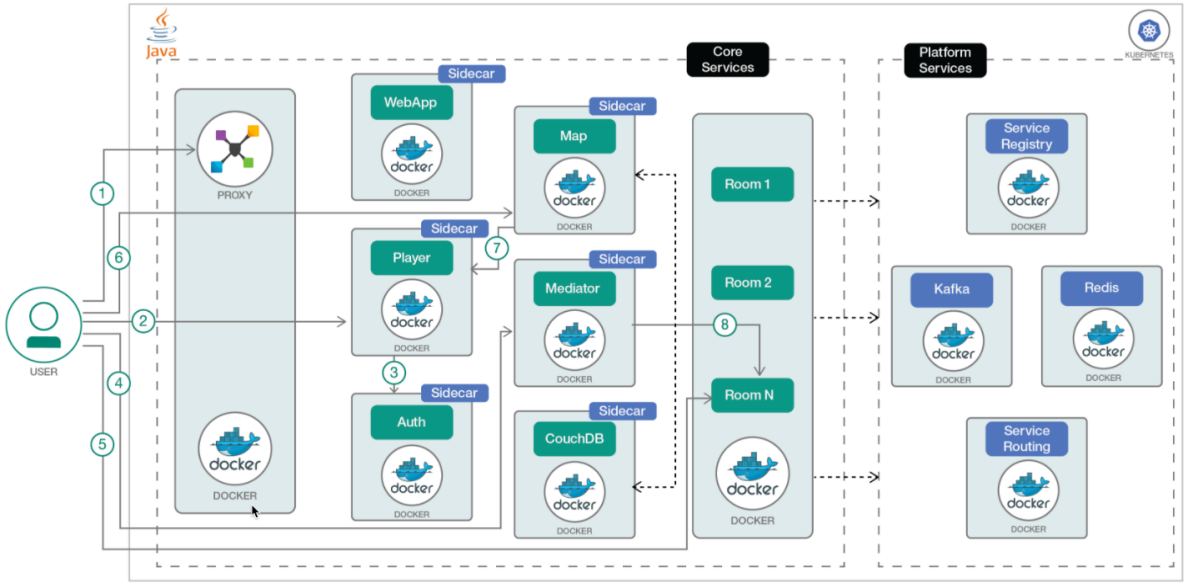


Developer Journeys: Spring Boot Microservices on Kubernetes

With current application architectures, microservices need to co-exist in polyglot environments. In this developer journey, you'll learn how to deploy a Java microservices application that runs alongside other polyglot microservices, leveraging service discovery, registration, and routing.

Developer Works Code: https://developer.ibm.com/code/journeys/deploy-java-microservices-on-kubernetes-with-polyglot-support/

Github: https://github.com/IBM/GameOn-Java-Microservices-on-Kubernetes

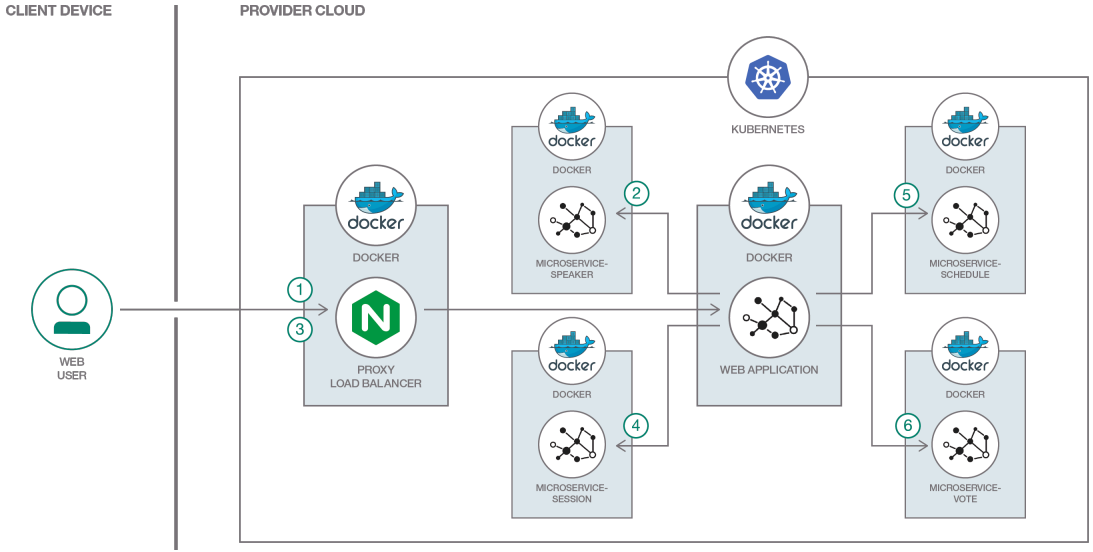


Developer Journeys: Java MicroProfile Microservices on Kubernetes

Java based Microservices application using MicroProfile (baseline for Java Microservices architecture) and Microservices Builder on Kubernetes

Developer Works Code: https://developer.ibm.com/code/journey/deploy-microprofile-java-microservices-on-kubernetes

Github: https://github.com/IBM/java-microprofile-on-kubernetes



Kubernetes is great for Microservices ...

Why do we need a Service mesh and what is it?

Container Orchestration = Scheduling, Cluster Management, and Discovery

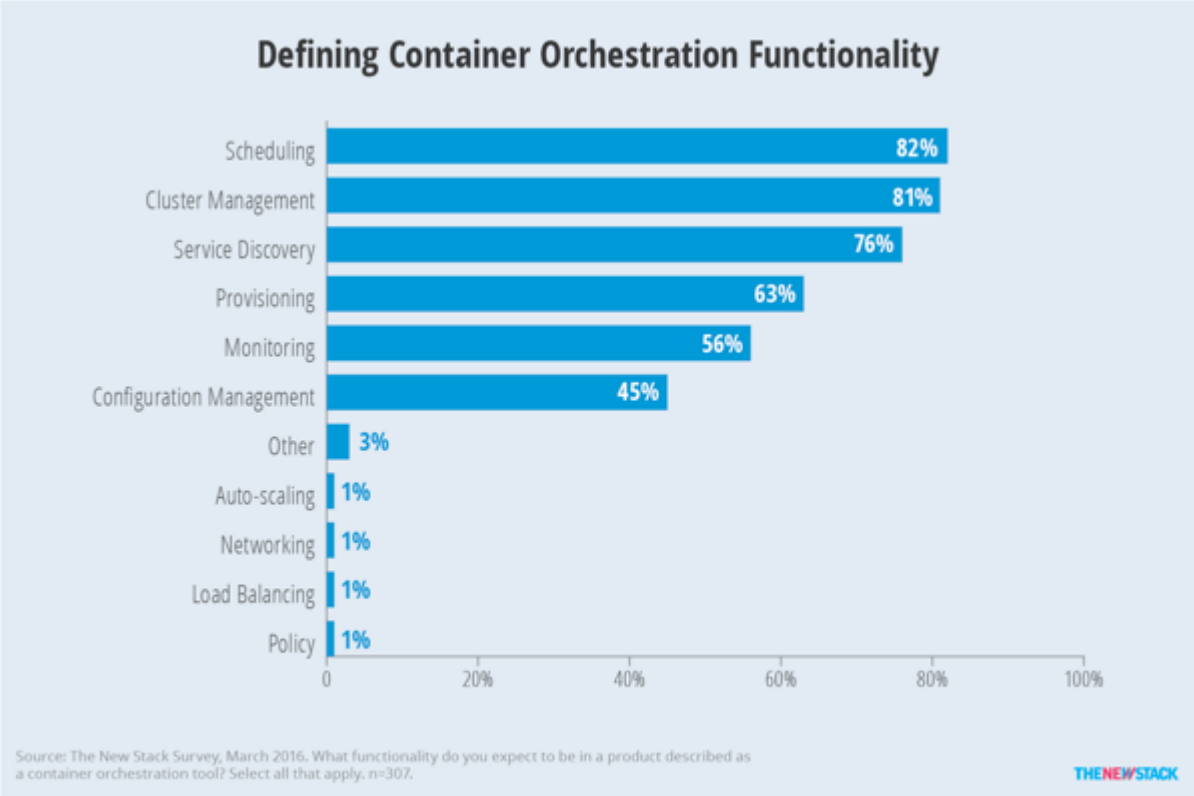


Figure 3: Only 45 percent of respondents consider configuration management to be part of a container orchestration product.

What else do we need for Microservices?

- Visibility
- Resiliency & Efficiency
- Traffic Control
- Security
- Policy Enforcement

Enter Service Mesh

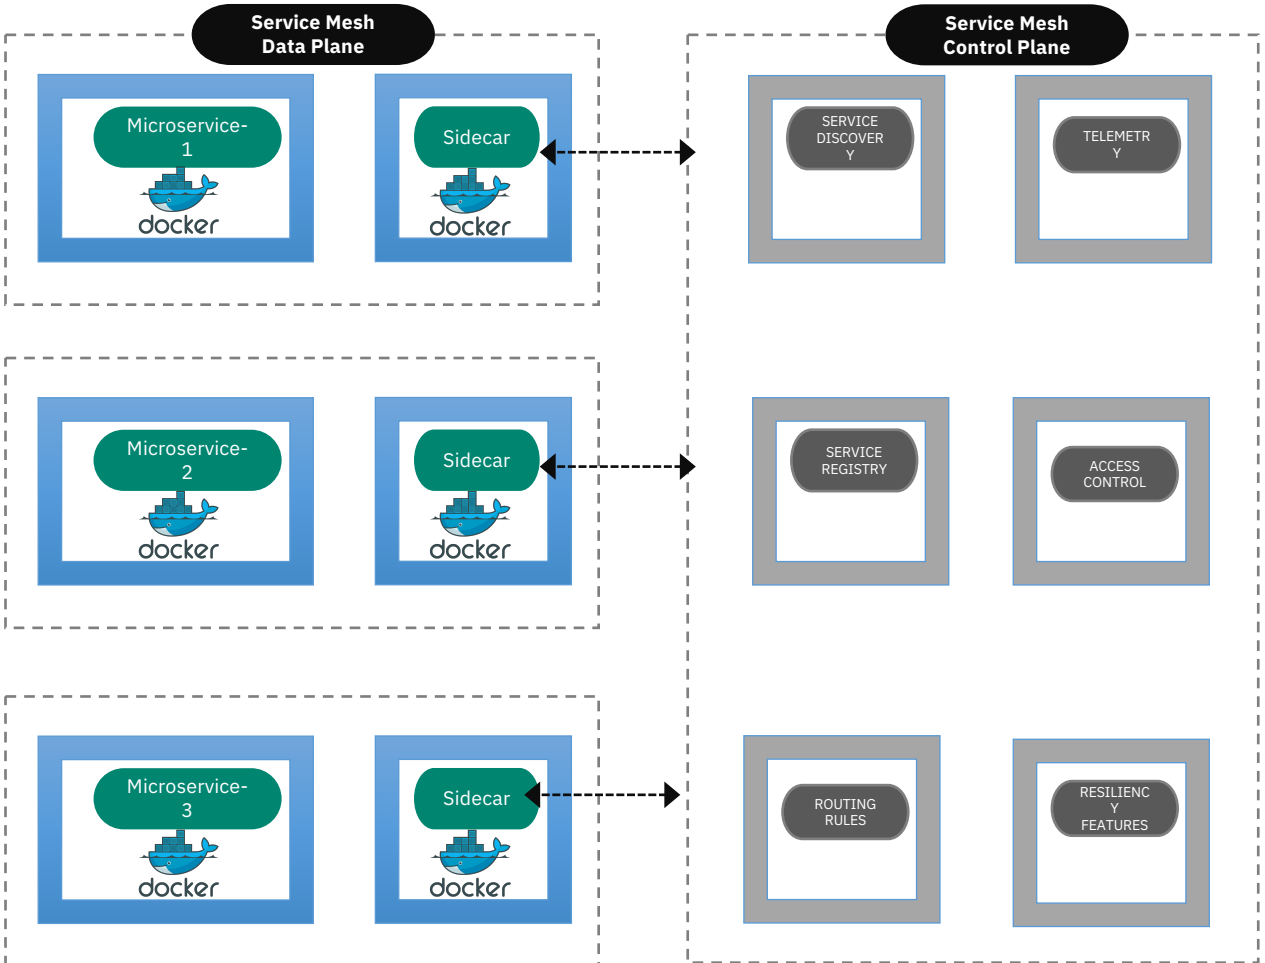
What is a ‘Service Mesh’ ?

A network for services, not bytes

- Visibility
- Resiliency & Efficiency
  - Traffic Control
- Security
- Policy Enforcement

How to build a ‘Service Mesh’ ?

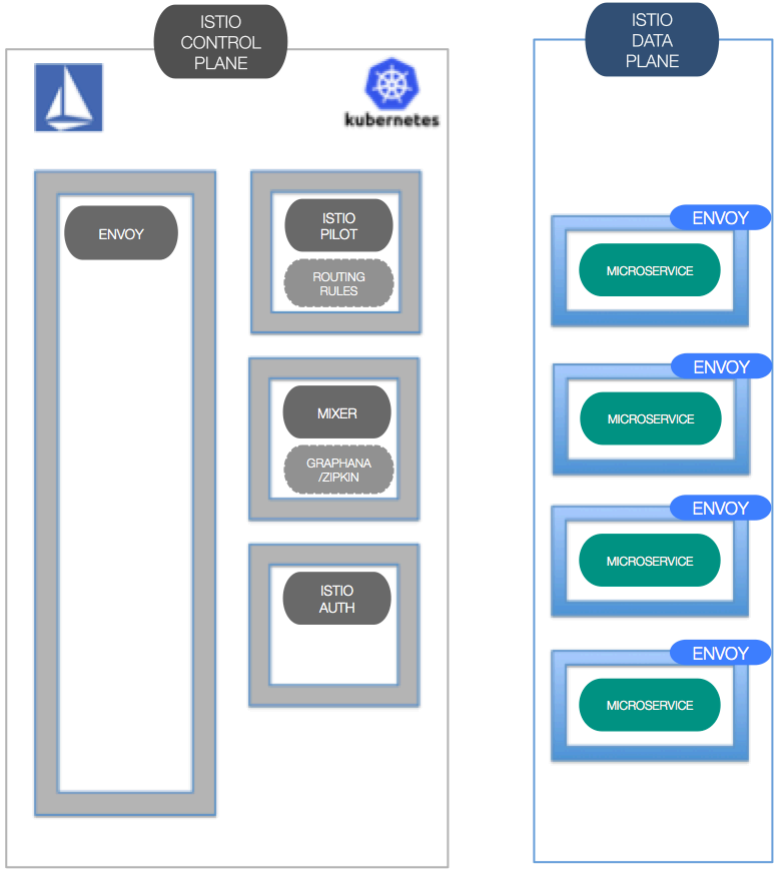
- Lightweight sidecars to manage traffic between services
- Sidecars can do ***much more*** than just load balancing!



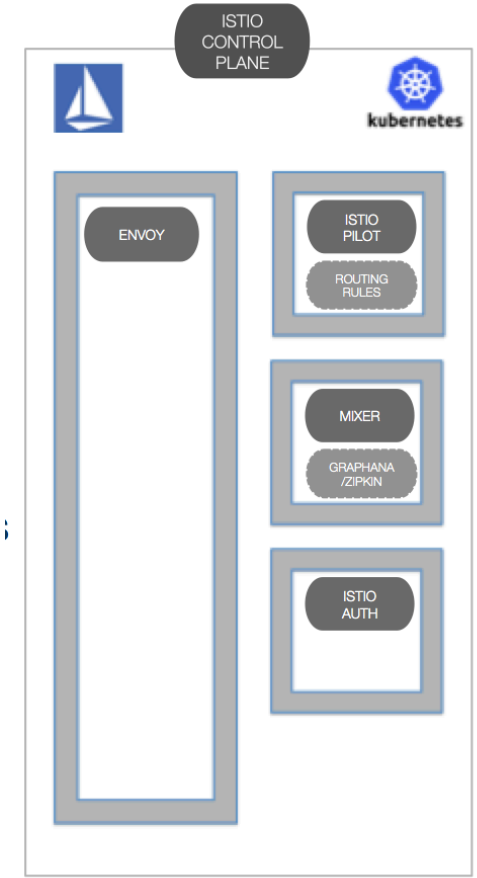
Istio

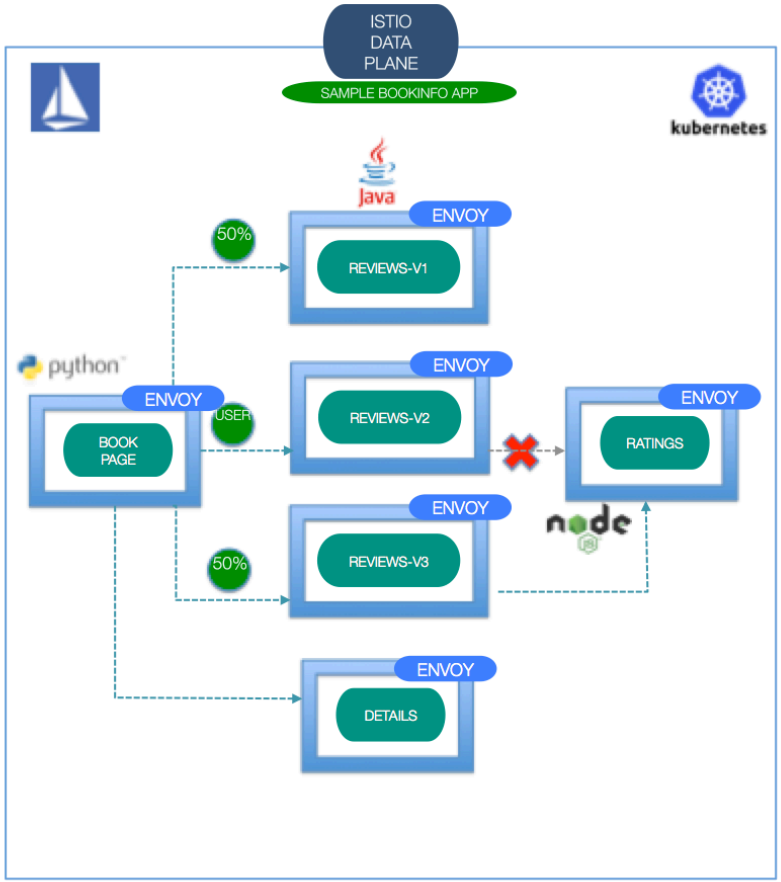
Istio Concepts

- Pilot - Configures Istio deployments and propagate configuration to the other components of the system. Routing and resiliency rules go here
- Mixer - Responsible for policy decisions and aggregating telemetry data from the other components in the system using a flexible plugin architecture
- Proxy – Based on Envoy, mediates inbound and outbound traffic for all Istio-managed services. It enforces access control and usage policies, and provides rich routing, load balancing, and protocol conversion.

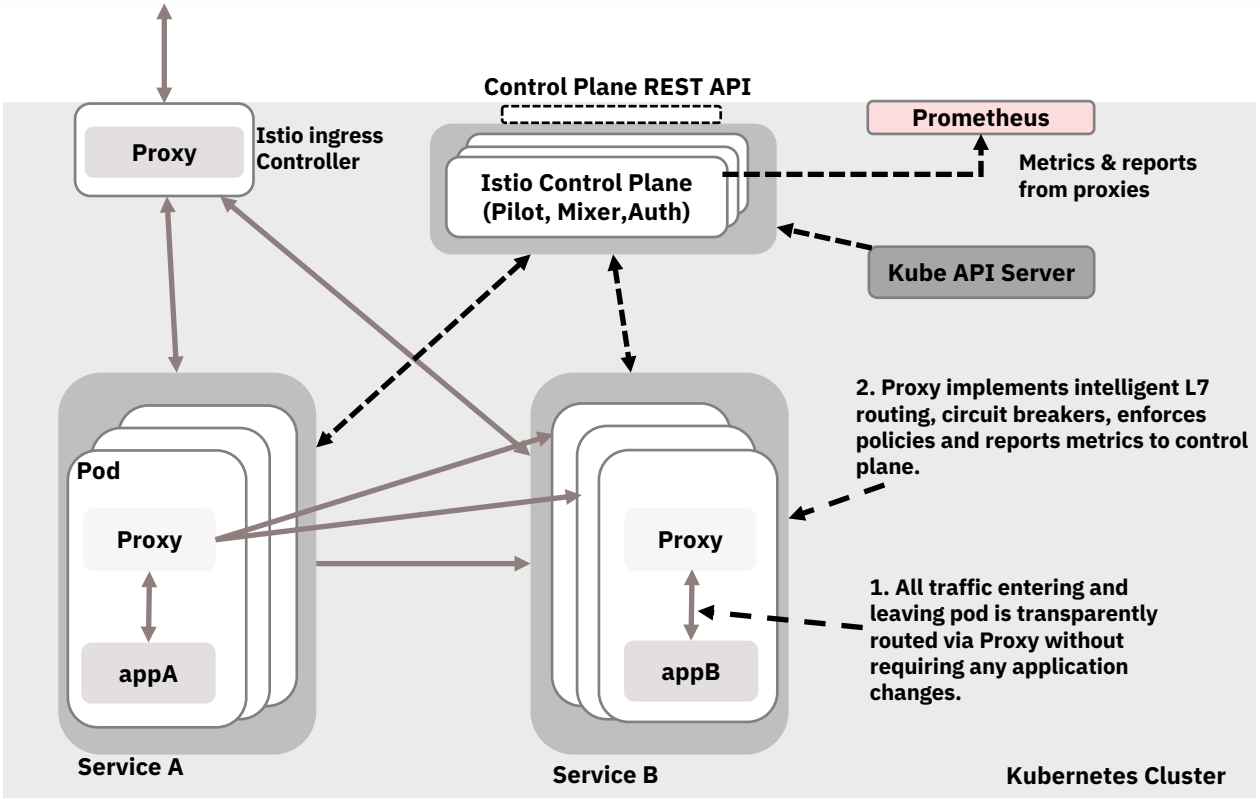


Istio Concepts





Istio Architecture



Proxy. Based on Envoy, a high performance L7 proxy from Lyft, currently being used at large scale in production. https://github.com/lyft/envoy

Istio control plane traffic. Request routing rules, resilience configuration (circuit breakers, timeouts, retries), policies (ACLs, rate limits, auth), and metrics/reports from proxies.

User/application traffic. HTTP/1.1, HTTP/2, gRPC, TCP with or without TLS

Kubernetes, Microservices and Istio Developer Journeys

What is a ‘Service Mesh’ ?

A network for services, not bytes

Resiliency & Efficiency

- Traffic Control
- Visibility
- Security
- Policy Enforcement

Resiliency

- Istio adds fault tolerance to your application without any changes to code

```
// Circuit breakers
destination: serviceB.example.cluster.local
policy:
- tags:
    version: v1
  circuitBreaker:
    simpleCb:
      maxConnections: 100
      httpMaxRequests: 1000
      httpMaxRequestsPerConnection: 10
      httpConsecutiveErrors: 7
      sleepWindow: 15m
      httpDetectionInterval: 5m
```

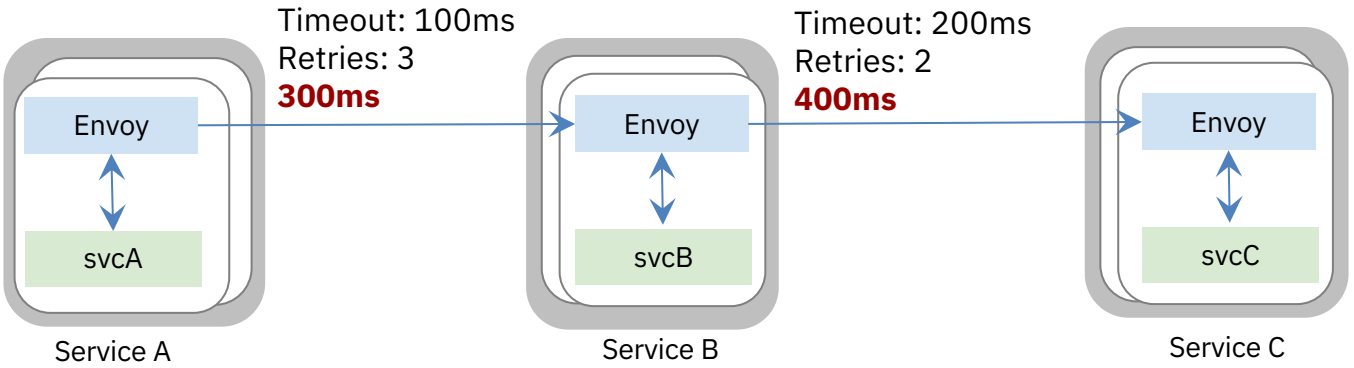
Resilience features

- Timeouts
- Retries with timeout budget
- Circuit breakers
- Health checks
- AZ-aware load balancing w/ automatic failover
- Control connection pool size and request load
- Systematic fault injection

Resiliency Testing

Systematic fault injection to identify weaknesses in failure recovery policies

- HTTP/gRPC error codes
- Delay injection

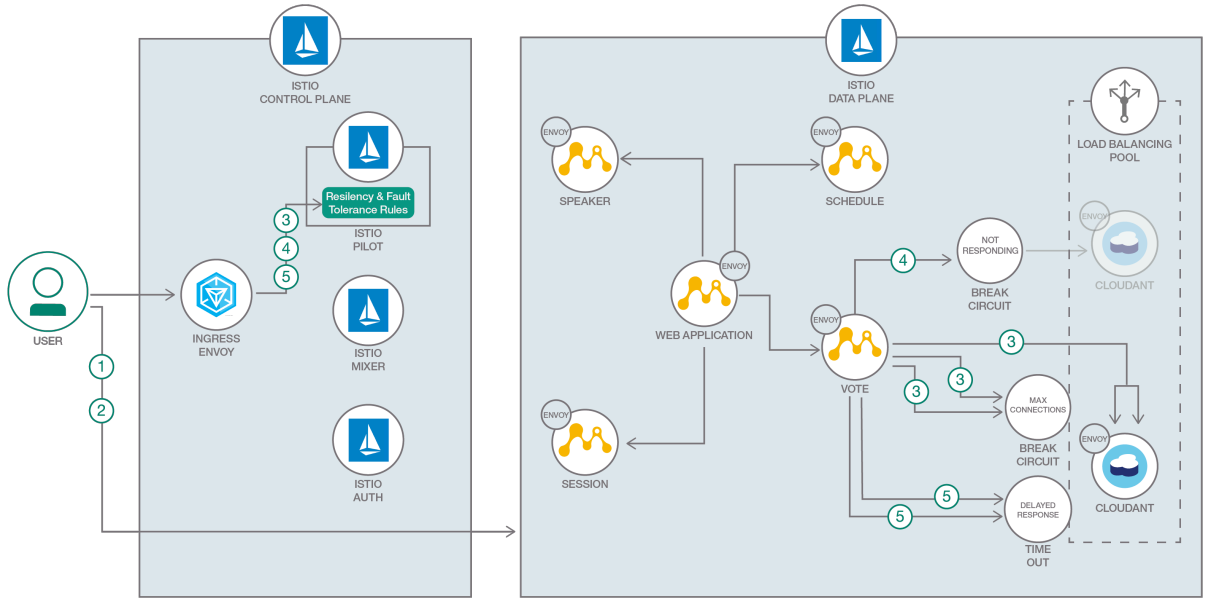


Developer Journey: Leverage Istio to create resilient and fault tolerant Microservices

Twelve-factor apps make a strong case for designing and implementing your microservices for failure. What that means is with the proliferation of microservices, failure is inevitable, and applications should be fault-tolerant. Istio, a service mesh, can help make your microservices resilient without changing application code.

Developer Works Code: https://developer.ibm.com/code/journey/make-java-microservices-resilient-with-istio/

Github: https://github.com/IBM/resilient-java-microservices-with-istio



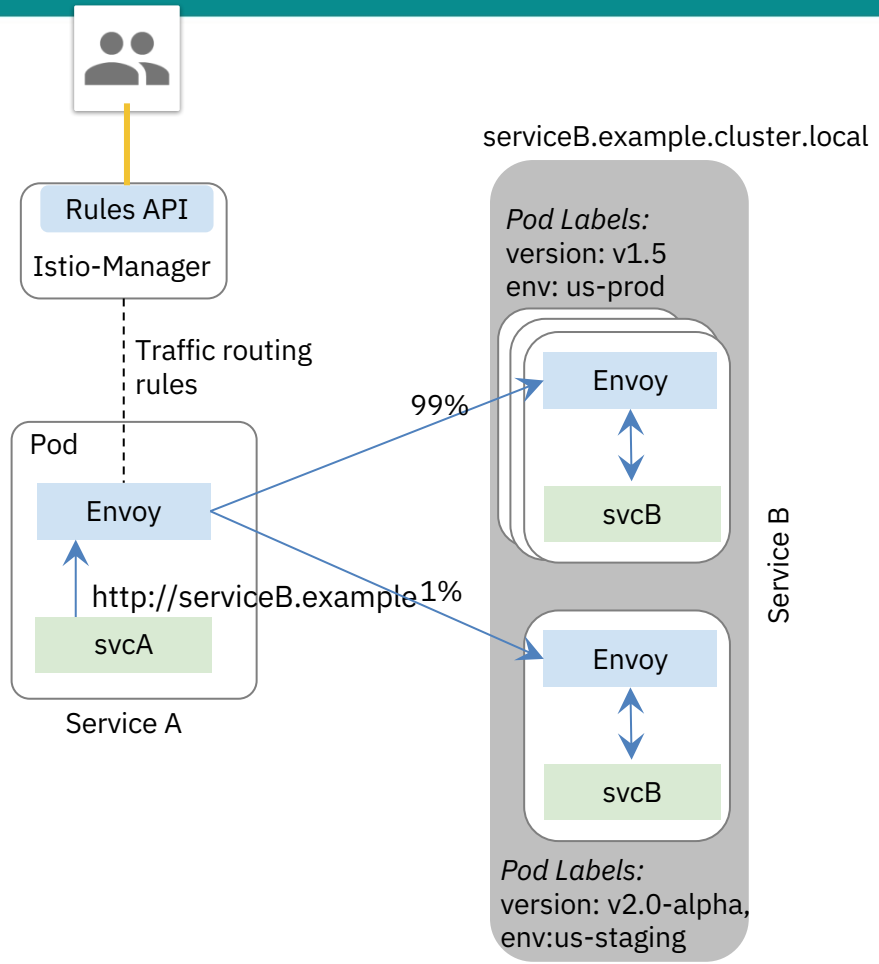
What is a ‘Service Mesh’ ?

A network for services, not bytes

- Resiliency & Efficiency
- Traffic Control
- Visibility
- Security
- Policy Enforcement

Traffic Splitting

```
// A simple traffic splitting rule
destination: serviceB.example.cluster.local
match:
  source: serviceA.example.cluster.local
route:
- tags:
    version: v1.5
    env: us-prod
  weight: 99
- tags:
    version: v2.0-alpha
    env: us-staging
  weight: 1
```

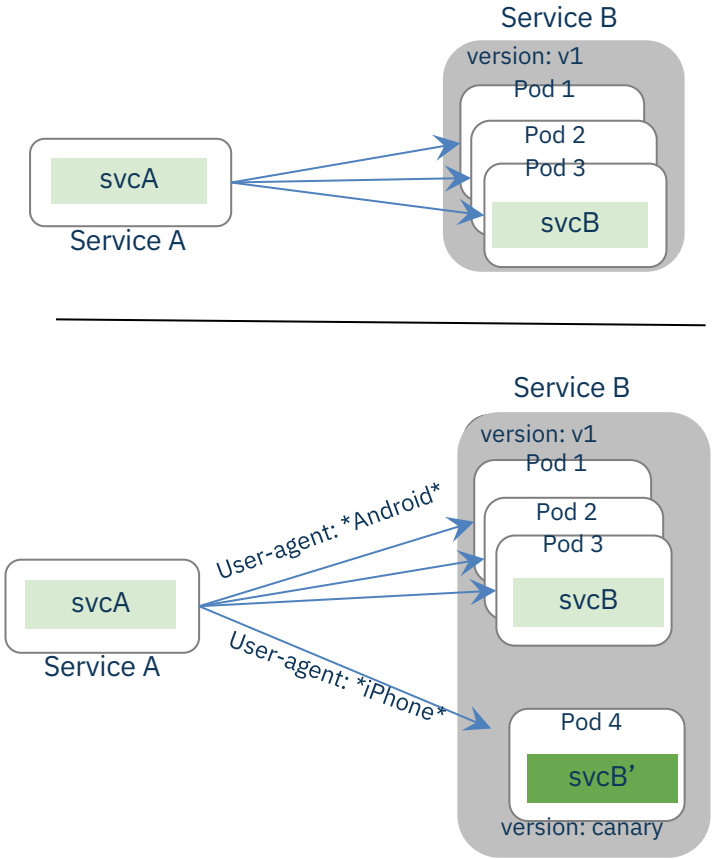


Traffic Steering

```
// Content-based traffic steering rule

destination: serviceB.example.cluster.local
match:
  httpHeaders:
    user-agent:
      regex: ^(.*?;)?(iPhone)(;.*)?$
precedence: 2
route:
- tags:
    version: canary
```

Content-based traffic steering

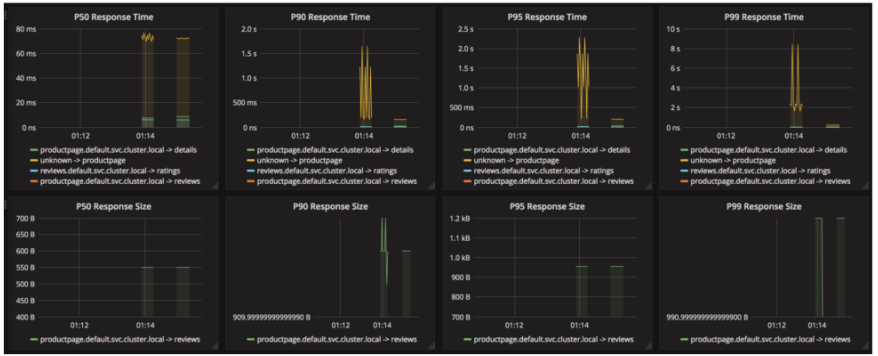


Visibility

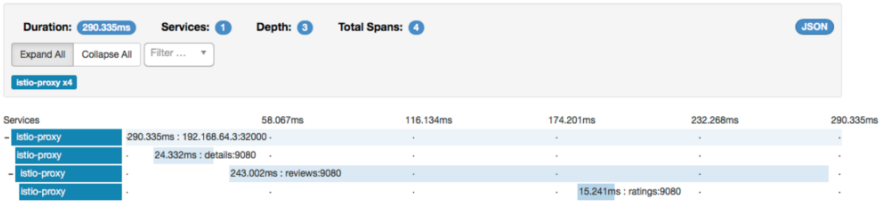
Monitoring & tracing should not be an afterthought in the infrastructure

Goals

- Metrics without instrumenting apps
- Consistent metrics across fleet
- Trace flow of requests across services
- Portable across metric backend providers



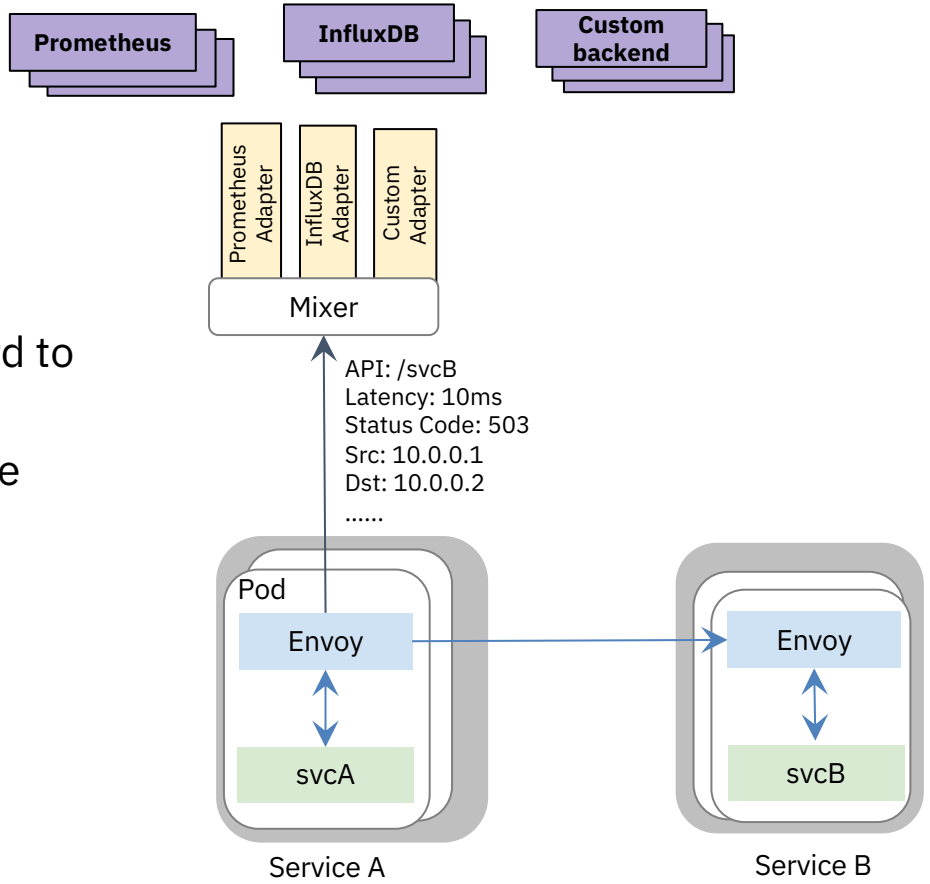
Istio - Grafana dashboard w/ Prometheus backend



Istio Zipkin tracing dashboard

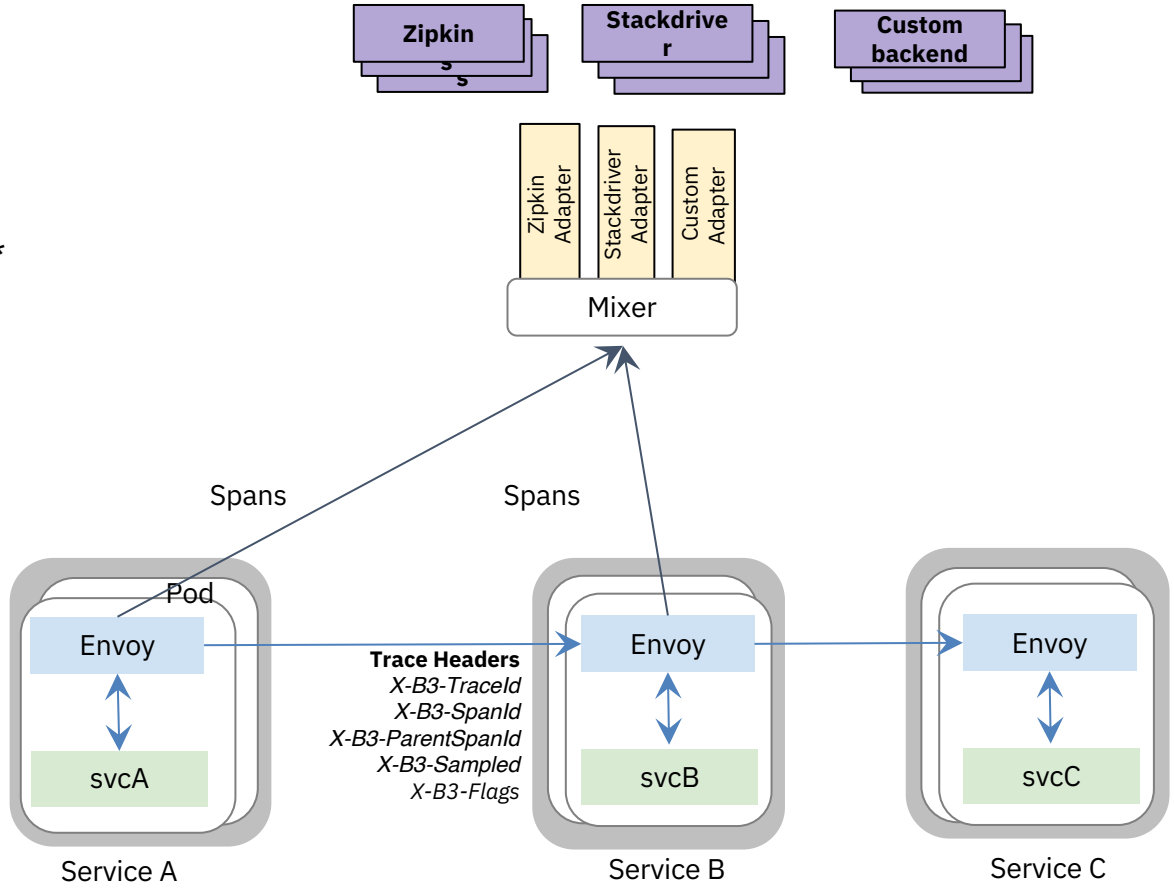
Metric Flow

- Mixer collects metrics emitted by Envoys
- Adapters in the Mixer normalize and forward to monitoring backends
- Metrics backend can be swapped at runtime



Visibility : Tracing

- Application do not have to deal with generating spans or correlating causality
- Envoys generate spans
  - Applications need to *forward* context headers on outbound calls
- Envoys send traces to Mixer
- Adapters at Mixer send traces to respective backends



Developer Journeys: Manage micro services traffic using Istio on Kubernetes

Microservices and containers have changed application design and deployment patterns. They have also introduced new challenges, such as service discovery, routing, failure handling, and visibility to microservices. Kubernetes can handle multiple container-based workloads, including microservices, but when it comes to more sophisticated features like traffic management, failure handling, and resiliency, a microservices mesh like Istio is required.

Developer Works Code: https://developer.ibm.com/code/journey/manage-microservices-traffic-using-istio/

Github: https://github.com/IBM/microservices-traffic-management-using-istio
